10 **Abstract class + Virtual function + Function overriding + Dynamic binding**

```
#include <iostream>
using namespace std;

// Abstract Base Class
class Payment {
public:
   virtual void pay() = 0;   // Pure virtual function
};

// Derived Class 1
class CreditCard : public Payment {
public:
   void pay() {   // Function overriding
      cout << "Payment done using Credit Card" << endl;
   }
};

// Derived Class 2
class UPI : public Payment {
public:
   void pay() {   // Function overriding
      cout << "Payment done using UPI" << endl;
   }
};

int main() {

   Payment *p;   // Base class pointer

   CreditCard c;
   UPI u;
```

10 **Abstract class + Virtual function + Function overriding + Dynamic binding**

```
    p = &c;     // Dynamic binding
    p->pay();

    p = &u;     // Dynamic binding
    p->pay();

    return 0;
}
```

```
Payment done using Credit Card
Payment done using UPI
